### Is Artificial Intelligence biased, evil, or worse?

Artificial Intelligence is one of the greatest creations of all time, don't get me wrong, but there need to be some serious changes. Up to this point in time, the technology which we have created has been incredible and shocked the world, but we have reached a breaking point of sorts. From this point forward, the technology we have made has grown to be so powerful, and advanced that it is growing out of our understanding and comprehension. Without stricter regulation on the inception and creation of higher intelligences in the artificial domain, this technology can easily leave us in the dust. AI isn't inherently evil, but it is inherently biased. Without bias, this AI would be unidirectional, and incapable of completing basic tasks. They are given reliance biases which feed them pointers to data and as they grow, they are fed less pointers. Once these AI are fully self-learning, they no longer need to rely on the pointers which are fed to them, and they can begin to form data patterns on their own. This initial pointer bias is what determines their learning patterns for all of their existence. If an AI is fed bad pointers, or unfairly biased pointers in a scenario where bias can have negative effect on those that the AI is trying to help, then they will forever be biased.

The problem that all of these issues accumulate to is the issue of bias in the final functionality of the AI. If the AI is biased from its conception, then it will continue to have these biases in its execution. Often times, these biases are non-intentional but may slip past the developers. If these make it into practice in an AI technology that has the potential to save or take a life, it can have serious impacts on the performance of this product.

AI may not be evil, but since it uses bias as one of its core elements for learning, then it can become dangerous in practice.
